

Teamwork From Anywhere

Voice, video & chat, brought to you by our MaX UC app.

Computer

Microsoft® Windows (7, 8, 10); Apple OS X® (10.7+)

Smartphone & Tablet

Apple iOS® (11.0+); Android™ (5.0+)

With MaX UC, you choose between two feature levels for each user:

- 1) MaX UC with Meeting:** Meeting is Audio/Video conferencing, powered by Zoom®. Use your MaX UC apps to host video conferences with up to 100 attendees, share your screen, use a whiteboard, and more. Save time and money when you stop travelling to meetings, and start meeting virtually.
- 2) MaX UC without Meeting:** Don't pay for video conferencing features that your users don't need. At its core, MaX UC is a softphone and IM/chat app that turns your computer, smartphone or tablet into your business phone extension.

Every MaX UC user receives the following Unified Communications features and benefits:

- **Protect Business Identity and Personal Privacy:** Make business calls from your smartphone, tablet or computer showing your business phone number on Caller ID, not your personal cellular number.
- **Maintain Professional Image:** Answer business calls anytime, on any device. Missed business calls go to your business - not personal - voicemail.
- **Chat/Instant Message** with other MaX UC app users on your team
- **Presence View:** See whether remote teammates are on the phone, away, or in a meeting (Outlook)
- **Visual Voicemail** and **Call History** features sync between devices, even an optional Poly® IP phone
- **Unique ringtones** for business number calls vs. personal cellular calls, so you can answer differently
- **Click-to-Dial** mode when used with an optional Poly IP phone
- **Sync contacts** with Microsoft Outlook™ or Mac Address Book™ (Computer App Only)
- **Integrate with Salesforce®**, SugarCRM® and other CRM databases (Computer App Only)

Optional Feature:

- **Add SMS/Text Messaging** to send and receive texts using the business phone number.

Calls made with MaX UC use data, not cellular minutes. Call/video quality while using any real-time communication application like Skype®, FaceTime® or POPP's MaX UC is only as good as the internet connection your device is using. A weak cellular data/WiFi signal or congested internet will result in poor call/video quality or missed calls.
